

Repair and testing service

We have the necessary equipment to perform repair, recovery and transformation work on mechanical seals and cartridge seals: the first step is to diagnose the state of the part and then carry out the necessary cleaning, polishing and lapping processes on the contact surfaces, rectification of parts and replacement of components, among others.

After the repair has been made we check the result in our test facilities through a pressure test in dynamic, static or both conditions, depending on the case.

These facilities provide additional service to our customers, and all our cartridge seals must succeed a static sealing control test at different pressures before delivery.

We provide spare parts for all our cartridges and we can adapt them to different combinations of materials on the contact surfaces and in O-rings, springs, gaskets etc. as well as offering faster and more flexible deliveries. All our operations are guaranteed by a static operating test after handling.

RMS +Kitting

The RMS seal range is compatible with the best known pump brands: Flygt®, Grundfos®, Sarlin®, ABS®, Alfal-Laval®, Hilge®, APV®, Fristam®, etc.; they are mechanical seals specially designed for wastewater, heating, food and beverage, pharmaceutical pumps and in a wide range of applications in all industrial sectors.

In most cases, when the pump is repaired the mechanical seal is not the only element that is replaced. The renewal of other parts is also recommended, such as O-rings or elements other seals with special profiles, bearings, pins, flat gasket joints, etc. We provide kits with these elements which we can supply along with the mechanical seal.

Auxiliary products

The auxiliary systems are provided with the mechanical seals in uses in which the integrity of the sealing must be guaranteed. These include tanks reservoirs for barrier and quench fluids that may include elements for controlling pressures, temperatures, levels, etc.

Standards

Our mechanical seals are compliant with the following standards for industries subject to the strictest regulations:

ATEX

Mechanical seals which are appropriate for installing in equipment certified in categories 2 and 3 of group II (2 G / D) cT2 in accordance with Directive 2014/34 / EU (ATEX) of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the Member States relating to equipment and protective systems for use in potentially explosive atmospheres.

European Regulation (EC) 1935/2004:

This regulation is mandatory in the European Union for all materials in contact with food. It controls the migration of substances from the raw materials to the product with which it is in contact.

FDA Regulation §177.2600, CFR 21

This legislation determines which materials are suitable for contact with food without being harmful for humans.

Selection criteria

TECHNICAL INFORMATION

Arrangement instructions

The alignment of the pump and engine shafts is a decisive factor in ensuring a proper lifespan of the mechanical seal. The alignment, measured for operation with all the conduits connected and duly fixed to the bench, must be within the values established by the pump manufacturer. It is advisable to use a coupling system which is flexible enough to isolate the pump from vibrations in other system elements, such as vibrations due to faulty bearings.

When installing, make sure that the different parts of the mechanical seal do not pass over sharp edges, splines or threads. All edges must be bevelled and rough areas eliminated or rounded. We recommend a bevel angle of approximately 15° and a length of 2 mm for diameters up to 50 mm and 3 mm or more for larger diameters. In the event of requiring lubrication to facilitate installation, we recommend using a water and neutral liquid soap solution. The use of oils and grease (even food-grade oils and grease) is strictly forbidden.

In mechanical seals with rotating parts fixed to the shaft by conical springs or bellows that convey movement, it is advisable to use a mounting cone to insert them. For conical springs the axial thrust will be accompanied by a rotating movement in the same direction as the spring coil. Before starting up the pump, check that the fluid is in contact with the mechanical seal. It is essential to prevent the seal from operating under dry conditions, even for a short length of time.

In the event of using auxiliary devices (Quench, washing flushing, etc.), make sure that the connections are correct.
